

Solución Prueba Ejemplo - Otto Klaus

Requerimiento 1

• Paso 1: Crear el entorno de desarrollo e instalar element-ui

```
vue create ottoklaus
cd ottoklaus
npm i -S element-ui
```

• Paso 2: Crear la vista Juguetes.vue

Juguetes.vue

```
<template>
  <div class="juguetes">
      <el-col><el-link @click="cerrarSesion">Cerrar
sesión</el-link></el-col>
      <el-col><h1>Bienvenido a Otto Klaus</h1></el-col>
    </el-row>
    <el-row>
      <el-button
        type="primary"
        icon="el-icon-plus"
        circle
        title="Agregar Juguete"
        @click="agregar"
      ></el-button>
    </el-row>
    <div>
      <el-table :data="juguetesConStock" lazy>
        <el-table-column prop="data.codigo"
label="Código"></el-table-column>
        <el-table-column prop="data.nombre"
label="Nombre"></el-table-column>
        <el-table-column prop="data.stock"
label="Stock"></el-table-column>
```

```
<el-table-column prop="data.precio"
label="Precio"></el-table-column>
        <el-table-column label="Acciones">
          <template slot-scope="scope">
            <el-button
              @click="editar(juguetesConStock[scope.$index])"
              type="text"
              size="small"
              >Editar</el-button
            <el-button
              @click="dialogEliminar(juguetesConStock[scope.$index].id)"
              type="text"
              size="small"
              >Eliminar
            </el-button>
          </template>
        </el-table-column>
      </el-table>
   </div>
 </div>
</template>
<script>
import { mapGetters, mapActions } from "vuex";
import Firebase from "firebase";
export default {
 data() {
   return {};
 },
 mounted() {
   this.getJuguetes();
 },
 computed: {
    ...mapGetters(["juguetesConStock"]),
 },
 methods: {
    ...mapActions(["getJuguetes", "eliminarJuguete"]),
   agregar() {
      this.$router.push({ name: "agregar" });
   editar(juguete) {
      this.$router.push({ name: "editar", params: { juguete: juguete }
```

```
});
    },
    dialogEliminar(jugueteID) {
      this.$confirm(
        "Borrará el juguete seleccionado. ¿Desea continuar?",
        "Warning",
          confirmButtonText: "Eliminar",
          cancelButtonText: "Cancelar",
          type: "warning",
        }
      )
        .then(async () => {
          await this.eliminarJuguete(jugueteID);
          let options = { type: "success", message: "Juguete eliminado"
};
          this.$message({
            ...options,
          });
        })
        .catch(() => {
          this.$message({
            type: "info",
            message: "Acción cancelada",
          });
        });
    },
    cerrarSesion() {
      Firebase.auth()
        .signOut()
        .then(
          (accept) => {
            this.$router.push({ name: "login" });
          },
          (reject) => {
            var errorCode = reject.code;
            this.loading = false;
            this.$message({
              showClose: true,
              message: reject.message,
              type: "error",
            });
          }
```

```
);
},
},
};
</script>

<style scoped>
.juguetes {
   padding: 60px;
}
</style>
```

• Paso 3: Crear la vista Agregar.vue

Agregar.vue

```
<template>
  <div>
   <h1>Agregar Juguete</h1>
    <el-form ref="form" :model="form" label-width="120px">
      <el-form-item label="Código">
        <el-input v-model="form.codigo"></el-input>
      </el-form-item>
      <el-form-item label="Nombre">
        <el-input v-model="form.nombre"></el-input>
      </el-form-item>
      <el-form-item label="Stock">
        <el-input v-model="form.stock"></el-input>
      </el-form-item>
      <el-form-item label="Precio">
        <el-input v-model="form.precio"></el-input>
      </el-form-item>
      <el-form-item>
        <el-button type="info" @click="volver">Volver</el-button>
        <el-button type="primary" @click="Agregar(form)"
          >Agregar Juguete</el-button
      </el-form-item>
    </el-form>
 </div>
</template>
```

```
<script>
import { mapActions } from "vuex";
export default {
 data() {
    return {
      form: {
        codigo: "",
        nombre: "",
        stock: "",
        precio: "",
      },
    };
 },
 methods: {
    ...mapActions(["agregarJuguete"]),
   Agregar(juguete) {
      this.agregarJuguete(juguete);
      const options = { type: "success", message: "Juguete agregado" };
      this.$message({
        ...options,
      });
      this.$router.push({ name: "juguetes" });
    },
    volver() {
      this.$router.push({ name: "juguetes" });
    },
 },
};
</script>
```

• Paso 4: Crear la vista Editar.vue

Editar.vue

```
<el-form-item label="Nombre">
        <el-input v-model="form.nombre"></el-input>
      </el-form-item>
      <el-form-item label="Stock">
        <el-input v-model="form.stock"></el-input>
      </el-form-item>
      <el-form-item label="Precio">
        <el-input v-model="form.precio"></el-input>
      </el-form-item>
      <el-form-item>
        <el-button type="info" @click="volver">Volver</el-button>
        <el-button type="primary" @click="dialogActualizar"
          >Actualizar Juguete</el-button
      </el-form-item>
    </el-form>
 </div>
</template>
<script>
import { mapActions } from "vuex";
export default {
  props: ["juguete"],
 data() {
   return {
      form: {
        codigo: "",
        nombre: "",
        stock: "",
        precio: "",
     },
   };
 },
 mounted() {
   this.form = this.juguete.data;
 },
 methods: {
    ...mapActions(["actualizarJuguete"]),
   dialogActualizar(juguete) {
      this.$confirm(
        "Actualizará el juguete seleccionado. ¿Desea continuar?",
        "Warning",
          confirmButtonText: "Actualizar",
          cancelButtonText: "Cancelar",
```

```
type: "warning",
        }
      )
        .then(async () => {
          const juguete = this.form;
          const id = this.juguete.id;
          await this.actualizarJuguete({ juguete, id });
          let options = { type: "success", message: "Juguete
actualizado" };
          this.$message({
            ...options,
          });
          this.$router.push({ name: "juguetes" });
        })
        .catch(() => {
          this.$message({
           type: "info",
            message: "Acción cancelada",
          });
        });
    },
    volver() {
     this.$router.push({ name: "juguetes" });
    },
 },
};
</script>
```

• Paso 5: Crear la vista Login.vue

Login.vue

```
<el-input
        type="password"
        placeholder="Contraseña"
        v-model="formLabelAlign.password"
        autocomplete="off"
      ></el-input>
      <el-button
        type="primary"
        :loading="loading"
        class="ingresar-login"
        @click="login"
        >Ingresar</el-button
    </el-form>
 </div>
</template>
<script>
import Firebase from "firebase";
export default {
 data() {
    return {
      formLabelAlign: {
        user: "ottoklaus@desafiolatam.com",
        password: "12345678",
      },
      loading: false,
    };
 },
 methods: {
    login() {
      this.loading = true;
      Firebase.auth()
        .signInWithEmailAndPassword(
          this.formLabelAlign.user,
          this.formLabelAlign.password
        )
        .then(
          (accept) => {
            this.$router.push("juguetes");
            this.loading = false;
```

```
},
          (reject) => {
            var errorCode = reject.code;
            this.loading = false;
            this.$message({
              showClose: true,
              message: reject.message,
              type: "error",
            });
          }
        );
   },
 },
};
</script>
<style lang="scss" scoped="">
#login {
  padding: 60px;
  .ingresar-login {
    width: 100%;
  }
  .img-inicial,
  .form-login {
    display: block;
    margin: auto;
    margin-bottom: 15px;
  }
  .form-login {
    width: 300px;
    .el-input {
      margin-bottom: 10px;
    }
  }
</style>
```

• Paso 1: Crear las acciones en Vuex para el CRUD

Store/index.js

```
actions: {
    getJuguetes({ commit }) {
      commit("loadingTable");
      firebase
        .firestore()
        .collection("juguetes")
        .onSnapshot((snapshot) => {
          const juguetes = [];
          snapshot.forEach((doc) => {
            juguetes.push({ id: doc.id, data: doc.data() });
          });
          commit("setJuguetes", juguetes);
        });
    },
    agregarJuguete({ commit }, juguete) {
      commit("loadingTable");
      firebase
        .firestore()
        .collection("juguetes")
        .add(juguete)
        .then(commit("loadingTable"));
    },
    eliminarJuguete({ commit }, jugueteID) {
      commit("loadingTable");
      firebase
        .firestore()
        .collection("juguetes")
        .doc(jugueteID)
        .delete()
        .then(commit("loadingTable"));
    async actualizarJuguete({ commit }, { juguete, id }) {
      commit("loadingTable");
      firebase
        .firestore()
```

```
.collection("juguetes")
      .doc(id)
      .set(juguete)
      .then(commit("loadingTable"));
  },
  getJuguegtesByPart({ commit }) {
    commit("loadingTable");
    firebase
      .firestore()
      .collection("juguetes")
      .where("codigo", "==", "A0001")
      .where("precio", ">", "2000")
      .onSnapshot((snapshot) => {
        const juguetes = [];
        snapshot.forEach((doc) => {
          juguetes.push({ id: doc.id, data: doc.data() });
        });
        console.log(juguetes)
      });
  },
},
```

• Paso 2: Crear las mutaciones en Vuex para el CRUD

Store/index.js

```
mutations: {
  setJuguetes(state, juguetes) {
    state.juguetes = juguetes;
    state.loading = false;
  },
  loadingTable(state) {
    state.loading = true;
  },
  eliminarJuguete(state, juguete) {
    state.juguetes = state.juguetes.filter((j) => {
      return j.codigo !== juguete.codigo;
    });
  },
  actualizarJuguete(state, juguete) {
    state.juguetes = state.juguetes.map((j) => {
      if (j.codigo == juguete.codigo) return juguete;
      else return j;
    });
  },
  agregarJuguete(state, juguete) {
    state.juguetes.push(juguete);
  },
},
```

• Paso 3: Crear el state en Vuex para el CRUD

Store/index.js

```
state: {
   juguete: {
    codigo: "",
    nombre: "",
    stock: 0,
    precio: 0,
   },
   edit: false,
   loading: false,
```

```
juguetes: [],
},
```

• Paso 1: Crear el getters en Vuex para filtrar los juguetes por stock

Store/index.js

```
getters: {
  juguetesConStock({ juguetes }) {
    return juguetes.filter((juguete) => juguete.data.stock > 0);
  },
},
```

• Paso 2: Incluir la computed property en la vista Juguetes.vue

Juguetes.vue

```
computed: {
    ...mapGetters(["juguetesConStock"]),
},
```

Requerimiento 4

• Paso 1: Incluir un método en Login.vue para la autenticación de usuario

Login.vue

```
methods: {
   login() {
     this.loading = true;
     Firebase.auth()
        .signInWithEmailAndPassword(
        this.formLabelAlign.user,
        this.formLabelAlign.password
     )
```

```
.then(
        (accept) => {
          this.$router.push("juguetes");
          this.loading = false;
        },
        (reject) => {
          var errorCode = reject.code;
          this.loading = false;
          this.$message({
            showClose: true,
            message: reject.message,
            type: "error",
          });
        }
      );
 },
},
```

• Paso 1: Agregar los guardianes (beforeEach) en Vue Router

```
router.beforeEach((to, from, next) => {
  let user = firebase.auth().currentUser;
  let authRequired = to.matched.some((route) => route.meta.login);

if (!user && authRequired) {
    next("login");
  } else if (user && !authRequired) {
    next("lista");
  } else {
    next();
  }
});
```

npm install -g firebase-tools
firebase login
firebase init
npm run build
firebase deploy
